THIS MANUAL MUST ACCOMPANY THE EQUIPMENT AT ALL TIMES.

P/N: 49103
PROPOSITION 65 WARNING / REPORTING SAFETY DEFECTS

WARNING

CALIFORNIA — Proposition 65 Warning

Diesel engine exhaust and some of its constituents are known to the State of California to cause cancer, birth defects and other reproductive harm.

REPORTING SAFETY DEFECTS

If you believe that your vehicle has a defect that could cause a crash or could cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA) in addition to notifying Multiquip at 1-800-421-1244.

If NHTSA receives similar complaints, it may open an investigation, and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in individual problems between you, your dealer, or Multiquip.

To contact NHTSA, you may either call the Vehicle Safety Hotline toll-free at 1-888-327-4236 (TTY: 1-800-424-9153), go to http://www.nhtsa.dot.gov; or write to:

Administrator
NHTSA
1200 New Jersey Avenue S.E.
Washington, DC 20590

You can also obtain information about motor vehicle safety from http://www.safecar.gov.

For Deutz/Lombardini Parts information, please see our LT-12 Deutz F3M1008F Diesel Engine Parts Manual.
Safety precautions should be followed at all times when operating this equipment. Failure to read and understand the Safety Messages and Operating Instructions could result in injury to yourself and others.

This Owner's Manual has been developed to provide complete instructions for the safe and efficient operation of the LT-12 Series Light Tower.

Before using this Light Tower, ensure that the operating individual has read and understands all instructions in this manual.

Safety Message Alert Symbols

The three (3) Safety Messages shown below will inform you about potential hazards that could injure you or others. The Safety Messages specifically address the level of exposure to the operator, and are preceded by one of three words: DANGER, WARNING, or CAUTION.

**DANGER**
You **WILL** be KILLED or SERIOUSLY injured if you **DO NOT** follow directions.

**WARNING**
You **CAN** be KILLED or SERIOUSLY injured if you **DO NOT** follow directions.

**CAUTION**
You **CAN** be INJURED if you **DO NOT** follow directions.

Potential hazards associated with the LT-12 Series Light Tower operation will be referenced with Hazard Symbols which appear throughout this manual, and will be referenced in conjunction with Safety Message Alert Symbols.

**HAZARD SYMBOLS**

**WARNING - Lethal Exhaust Gasses**
Engine exhaust gases contain poisonous carbon monoxide. This gas is colorless and odorless, and can cause death if inhaled. **NEVER** operate this equipment in a confined area or enclosed structure that does not provide ample free flow air.

**WARNING - Explosive Fuel**
DieSEL fuel is extremely flammable, and its vapors can cause an explosion if ignited. **DO NOT** start the engine near spilled fuel or combustible fluids. **DO NOT** fill the fuel tank while the engine is running or hot. **DO NOT** overfill tank, since spilled fuel could ignite if it comes into contact with hot engine parts or sparks from the ignition system. Store fuel in approved containers, in well-ventilated areas and away from sparks and flames.

**WARNING - Burn Hazards**
Engine components can generate extreme heat. To prevent burns, **DO NOT** touch these areas while the engine is running or immediately after operations. Never operate the engine with heat shields or heat guards removed.

**CAUTION - Respiratory Hazard**
ALWAYS wear approved respiratory protection when required.
Other important messages are provided throughout this manual to help prevent damage to your light tower, other property, or the surrounding environment.

**NOTE**

This light tower, other property, or the surrounding environment could be damaged if you do not follow instructions.

**CAUTION - Rotating Parts**

NEVER operate equipment with covers, or guards removed. Keep fingers, hands, hair and clothing away from all moving parts to prevent injury.

**CAUTION - Accidental Starting**

ALWAYS place the power source, circuit breakers or ON/OFF switch in the OFF position, when the generator is not in use, unless connected to transfer switch.

**CAUTION - Sight and Hearing Hazards**

ALWAYS wear approved eye and hearing protection.

**CAUTION - Over-Speed Conditions**

NEVER tamper with the factory settings of the engine governor settings. Personal injury and damage to the engine or equipment can result if operating speed ranges above maximum allowable.
WARNING - READ THIS MANUAL

Failure to follow instructions in this manual may lead to Serious Injury or even Death. This equipment is to be operated by trained and qualified personnel only! This equipment is for industrial use only.

The following safety guidelines should always be used when operating the LT-12 Lighttower.

Safety

- **DO NOT** operate or service this equipment before reading this entire manual.
- This equipment should not be operated by persons under 18 years of age.
- **NEVER** operate this equipment without proper protective clothing, shatterproof glasses, steel-toed boots and other protective devices required by the job.
- **NEVER** operate this equipment when not feeling well due to fatigue, illness or taking medicine.
- **NEVER** operate the saw under the influence or drugs or alcohol.
- **NEVER** use accessories or attachments, which are not recommended by Stow for this equipment. Damage to the equipment and/or injury to user may result.
- Manufacturer does not assume responsibility for any accident due to equipment modifications. Unauthorized equipment modification will void all warranties.
- Whenever necessary, replace nameplate, operation and safety decals when they become difficult read.
- **ALWAYS** check all the bolts on the light tower for tightness.
- **NEVER** touch the hot exhaust manifold, muffler or cylinder. Allow these parts to cool before servicing engine or generator.
- **High Temperatures** – Allow the engine to cool before adding fuel or performing service and maintenance functions. Contact with hot components can cause serious burns.

The engine of this light tower/generator requires an adequate free flow of cooling air. **NEVER** operate the generator in any enclosed or narrow area where free flow of the air is restricted. If the air flow is restricted it will cause serious damage to the generator engine and may cause injury to people. Remember the engine of the light tower/generator gives off **DEADLY** carbon monoxide gas.

- **ALWAYS** refuel in a well-ventilated area, away from sparks and open flames.
- **ALWAYS** use extreme caution when working with flammable liquids. When refueling, **stop the** engine and allow it to cool. **DO NOT smoke** around or near the machine. Fire or explosion could result from fuel vapors, or if fuel is spilled on a hot engine.
- **NEVER** operate the light tower/generator in an explosive atmosphere or near combustible materials. An explosion or fire could result causing severe bodily harm or even death.
- Topping-off to filler port is dangerous, as it tends to spill fuel.
- **ALWAYS** make sure that the light tower/generator is secure on level ground so that it cannot slide or shift around, endangering workers. Also keep the immediate area free of bystanders.
- **ALWAYS** use a trained technician to install and remove a floodlight, or replace any damaged fixture wiring.
- **NEVER** leave any grease or oil residue on glass surface when replacing or removing bulbs. This can create hot spots, reducing the service life of the bulb or causing outer jacket to burst.
- **ALWAYS** make sure trailer is leveled with all outriggers extended before raising tower. Outriggers must remain extended while tower is up.
- **ALWAYS** keep area behind trailer clear of people while raising and lowering mast.
- **NEVER** remove safety pin or pull mast locking pin while tower is in an raised position!
- **CHECK** the mast and winch cables for wear. If any problem occurs when lower or raising the tower **STOP** immediately! Contact a trained technician for assistance.
- **NEVER** pivot or retract mast while unit is operating.
DANGER - High Danger Areas

The 5 DANGER items listed below are considered High DANGER areas and should be adhered to. Failing to understand these areas could result in Bodily Harm, Electrical Shock, Electrocution, and even Death! Please pay close attention when operating the light tower.

DANGER - Grounding the LT-12 for Operation

The LT-12 Light tower is equipped with a ground terminal for your protection. ALWAYS complete the grounding path from the light tower to an external grounding source.

ALWAYS make certain the light tower is well grounded and securely fastened to a good earth ground (ground rod). The possibility exists of Electrical Shock, Electrocution, and even Death if the light tower is not grounded.

DANGER - Electric Shock Hazards

NEVER operate the LT-12 Light tower or handle any electrical equipment while standing in water, while bare foot, while hands are wet, or in the rain. A dangerous electrical shock could occur causing Severe Bodily Harm or even Death.

ALWAYS keep electrical cords in good condition. Worn, bare or frayed wiring can cause electrical shock, thus causing Bodily Harm or even Death.

NEVER grab or touch a live power cord with wet hands, the possibility exists of Electrical Shock, Electrocution, and even Death!

NEVER use the light tower mast as a crane. DO NOT lift anything with the mast.

NEVER attach anything to the light tower mast.

ALWAYS keep the immediate area surrounding the light tower clean, neat, and free of debris.

ALWAYS lower the tower when not in use, or if high winds or electrical storms are expected in the area.

NEVER pivot or retract mast while unit is operating.

DANGER - Overhead Obstruction Danger

ALWAYS make sure the area above Light tower is open and clear of overhead power lines and other obstructions. The tower extends in excess of 30 ft. (9 meters). Contact with overhead powerlines or other obstructions could result in equipment damage, Serious Injury or Death!

■ NEVER touch bulbs while in use. Bulbs become extremely hot when in use! Allow bulbs and fixture to cool at least 10-15 minutes before handling.

■ ALWAYS retract the mast before lowering the tower to transport position.

Maintenance Safety

■ NEVER lubricate components or attempt service on a running light tower/generator.

■ ALWAYS allow the light tower/generator a proper amount of time to cool before servicing.

■ Keep the light tower/generator in proper running condition.

■ Fix damage to the light tower/generator immediately and always replace broken parts.

Emergencies

■ ALWAYS know the location of the nearest fire extinguisher.

■ ALWAYS know the location of the nearest first aid kit.

■ In emergencies always know the location of the nearest phone or keep a phone on the job site. Also know the phone numbers of the nearest ambulance, doctor and fire department. This information will be invaluable in the case of an emergency.
Machine Safety Decals

This dedicated light tower is equipped with a number of safety decals. These decals are provided for operator safety and maintenance information. The illustration below and on the next page shows these decals as they appear on the machine. Should any of these decals become unreadable, replacements can be obtained from your dealer.

Figure 1. Operation and Safety Decals

</table>
The Stow LT-12 Series Light Tower is a dedicated general purpose floodlight tower intended for emergency and remote lighting conditions.

The light tower can be raised vertically in excess of 31.5 feet (9.6 meters) by means of a manual winch. The tower tensioning system is designed to provide the necessary tension to safely control the pivot of the tower. Outriggers and rear support stand must be deployed prior to raising the mast.

The lighting system of Stow's LT-12 Series Light Tower is comprised of 4 "Metal Halide" 1000 watt lamps. Each lamp has an output of 110,000 lumens yielding a total of 440,000 lumens for all four floodlights. Typical lighting coverage is between 5 to 7 acres.

Each floodlight requires a ballast for starting. Located on the control panel of the generator is a weather resistant ballast box that contains the ballast for each floodlight. The control panel contains four ON/OFF circuit breakers for each floodlight.

For ease of service or transport, each floodlight is equipped with a quick-disconnect connector that allows the lamp fixture to be removed quickly. This feature is extremely useful during transport of the light tower over rough terrain. It is always best to remove the floodlights and pack them safely so they will not get damaged.

As an added feature, the LT-12 is available with two auxiliary output receptacles. The upper most receptacle (twist-lock), located at the front of the light tower, can provide 240 VAC at 25 amps. The bottom receptacle is a GFCI receptacle which can supply 120 VAC at 15 amps. These receptacles that can be used for light power tools or other similar applications.

Some LT-12 Light towers are equipped with a Lombardini Diesel Engine. All procedures & references to Deutz engines in this manual may be applied to Lombardini engines unless specifically noted otherwise.

ALWAYS make sure the area above Light tower is open and clear of overhead power lines and other obstructions. The tower extends in excess of 30 ft. (9 meters). Contact with overhead powerlines or other obstructions could result in equipment damage, Serious Injury or Death!

The LT-12 SERIES LIGHT TOWER — GENERAL INFORMATION
Figure 3 and 4 shows the location of the controls and components for the LT-12 Series Light Tower. The functions of each control is described below:

1. **Mast Rotation Locking Knob** – Unscrew this knob to release mast for rotation.

2. **Vertical Mast Extension Winch** – Use this winch to extend the mast to the desired height. Maximum height is approximately 31.5 feet (9.6 meters).

3. **Mast Rotation Handle** – Grip this handle to rotate mast to desired position. To lock mast, tighten mast rotation locking knob.

4. **Lifting Bail** – When lifting of the light tower by crane is required, use this lifting bail. Note: this lifting bail is balanced for a fully configured light tower; removal of any light tower components will un-balance the lifting bail.

5. **Forklift Pockets** – When lifting of the light tower is required, use these fork lift pockets to lift the light tower. Remember to insert the forks of the fork lift a minimum of 24 inches into the mast fork lift pockets.

6. **Mast Cradle Support** – When towing of the light tower is required, place the tower mast into the cradle support. Make sure tower release pin has been inserted and mast is locked.

7. **T-Bar** – Allows the floodlights to be mounted vertically or horizontally.

8. **Flood Light** – 1000 watt "Metal Halide" type bulb with a 110,000 lumens capacity. Light coverage is typically between 5 to 7 acres.

9. **Tower Lock/Release Pin** – Pull this pin to release tower mast from cradle support.

10. **Jack Stands** – There are two trailer jack stands, which are located at the front and rear of the trailer. Use these 2 jack stands to level and support the light tower.

11. **Chock Blocks** – Place these blocks (not included as part of the light tower package) under each trailer wheel to prevent rolling.

12. **Outrigger Jacks** – Use these 2 outrigger jacks to level and support the light tower.

13. **Control Panel/ Ballast Compartment** – This panel contains the ON/OFF circuit breakers for each flood light. In addition, located behind the control panel are the ballasts and electrical components for each floodlight.

14. **Safety Chain** – Always attach safety chain to the towing vehicle. Never tow the light tower with the safety chain unattached.

15. **Ball Hitch Coupler** – Attach this coupler to the towing vehicle. Use only the specified ball diameter as indicated on your coupler. Use of any other ball diameter will create an extremely dangerous condition which can result in separation of the coupler and ball or ball failure.

16. **Vertical Mast Winch** – Use this winch to raise the mast to the vertical position. Once mast is in the full vertical position, the locking pin engages automatically.

17. **Mast Locking/Release Pin** – Pull this pin to start placing the tower mast in the vertical position. Locking pin automatically engages when tower mast has reached full vertical position.
18. **Engine Exhaust Pipe** – Directs engine exhaust to the rear of the light tower. **NEVER** block this exhaust pipe with obstructions. **ALWAYS** place the generator in an area free of obstructions.

---

**CAUTION - Burn Hazard**

The exhaust pipe will become extremely hot when the engine is in use. **NEVER** touch the exhaust pipe when the engine is running. The possibility exists of severe burns to the skin. Allow the exhaust pipe to **cool** before touching.

19. **License Light** – This light illuminates the license plate. Whenever towing of the light tower is required, make sure this light is operational.

20. **Brake Lights** – Before towing the light tower, make sure that these lights are operational and are working correctly. **NEVER** tow the light tower if these lights are inoperative.

---

21. **Tires** – This light tower uses a ST175-13C size tire. Replace with only recommended tire size. **NEVER** tow light tower with bad or worn tires.

22. **Documentation Box** – Contains information regarding the light tower.

23. **240 VAC Twist-Lock Receptacle** – This twist-lock receptacle provides 240 VAC, 25 amps.

24. **120 VAC GFCI Receptacle** – This GFCI receptacle provides 120 VAC, 15 amps.
Figure 5. Control Panel Components and Indicators

DISPLAY = NOT USED
\( \times \) = NOT USED
Figure 5 shows the location of the basic control panel components for the LT-12 Light Tower. Listed below is a brief explanation of each control or component.

1. **Internal Cabinet Light Switch** – This switch controls the internal cabinet light for the light tower control panel. When the cabinet door is raised, the light will automatically come on. When the cabinet door closes, the switch is depressed and the light turns off.

2. **Internal Cabinet Light** – Provides illumination for the LT-12 control panel during nighttime operation. The light is activated when the cabinet door is raised.

3. **Hour Meter** – This digital hour meter indicates the number of hours machine has been in use.

4. **Main Circuit Breaker** – A double-pole 25 amp, ON/OFF circuit breaker which protects the 240 VAC twist-lock receptacle from overload. In addition it allows voltage to be supplied to the GFCI receptacle and 15 amp breakers (4).

5. **GFCI Receptacle Circuit Breaker** – A single-pole, 15 amp, ON/OFF circuit breaker which protects the GFCI receptacle from overload.

6. **Flood Light Circuit Breakers** – A single-pole, 15 amp, ON/OFF circuit breaker for each floodlight (4).

Items 7 - 11 refer to the Perkins Engine Control Panel only. See Figure 5.

7. **Air Filter Indicator Alarm Light** – This alarm light flashes when a problem with the air filter is detected. Service as required.

8. **Water Temperature Alarm Light** – This alarm light flashes when the water temperature becomes too hot for normal engine operation. Service as required.

9. **Oil Pressure Alarm Light** – This alarm light flashes when the oil pressure has fallen to low for normal engine operation. Service as needed.

10. **Pre-Heat Indicator Light/Battery Charge Light** – Indicates when the glow plugs have been heated up for starting the engine. If the light is flashing, a low battery charge is detected.

11. **Ignition Key Switch** – Insert key into ignition switch and turn clockwise to the ON position to warm the glow plugs. When glow plug indicator light goes OFF, turn the key to the START position. Release key when engine starts.

12. **Normal Operation Indicator Light** – This indicator light is illuminated when the engine is functioning normally.

13. **Low Oil Shutdown Indicator Light** – This indicator light is illuminated when the engine has shut down due to low oil pressure. Service as needed.

14. **High Temperature Indicator Light** – This indicator light is illuminated when the engine has shut down due to high water temperature. Service as needed.

15. **Alternator Indicator Light** – This indicator light is illuminated when the engine has shut down due to high water temperature. Service as needed.

16. **Glow Plug Indicator Light** – This indicator light is illuminated when the glow plugs have been heated for starting the engine.

17. **Air Filter Restriction Indicator Light** – This indicator light is illuminated when the engine has shut down due to blockage in the air filter. Service as needed.

18. **Ignition Key Switch** – Insert key into ignition switch and turn clockwise to the ON position to warm the glow plugs. When glow plug indicator light goes OFF, turn the key to the START position. Release key when engine starts.
Light Plot represents a mast extended to 30’ with 4 lights illuminated, tilted down 20°

LT-12 SERIES LIGHT TOWER — TOWING GUIDELINES

Towing Safety Precautions

CAUTION - Local Towing Regulations

To reduce the possibility of an accident while transporting the light tower on public roads, always make sure that the trailer and the towing vehicle are in good operating condition and both units are mechanically sound.

The following list of suggestions should be used when towing the light tower:

- Make sure that the hitch and coupling of the towing vehicle are rated equal to, or greater than the trailer "gross vehicle weight rating" (GVWR). See Table 1 for light tower weight.
- ALWAYS inspect the hitch and coupling for wear. NEVER tow the light tower's trailer with defective hitches, couplings, chains etc.
- CHECK the tire air pressure on both the towing vehicle and the trailer. Also check the tire tread wear on both vehicles.
- ALWAYS make sure the trailer section of the light tower is equipped with a "Safety Chain".
- ALWAYS attach trailer's safety chain to frame of towing vehicle.
- ALWAYS make sure that the vehicle and trailer directional, backup, brake, and trailer lights are connected properly and are working properly.
- Remember in most cases the maximum speed unless otherwise posted for highway towing is 55 MPH, however before towing your light tower, check your local state, and county vehicle towing requirements. Recommended off-road towing is not to exceed 15 MPH or less depending on type of terrain.
- Place chocked blocks underneath wheel to prevent rolling, while parked.
- Depending on soil conditions and location it may be necessary to place support blocks underneath the trailer's bumper to prevent tipping, while parked.
- Inflating tires to correct pressure, inspect tires for cuts, and excessive wear. See Table 3 (Tire Wear Troubleshooting).
- Check wheel mounting lug nuts with a torque wrench. Torque wheel lug nuts as described in the "Lug Nut Torque Requirements", Table 5.
- Check tightness of hanger bolt, shackle bolt, and U-blots nuts, torque suspension hardware per Table 4.
- Avoid sudden stops and starts. This can cause skidding, or jackknifing. Smooth, gradual starts and stops will improve gas mileage.
- Avoid sharp turns to prevent rolling.
- Swivel all jackstands parallel to the ground before transporting.
- DO NOT transport light tower with fuel in the generator fuel tank.

NOTE

Remember, when transporting of the light tower is required, always remove the floodlights and pack them safely so they will not get damaged.

CAUTION - Defective/Damaged Trailer Couplings

If the trailer coupler is deformed replace entire coupler. NEVER tow the light tower with a defective trailer coupler. There exist the possibility of the trailer separating from the towing vehicle.

Light Tower Trailer Vehicle Connection

1. Check the vehicle hitch ball, and trailer coupler for signs of wear or damage. Replace any parts that are worn or damaged before towing.
2. Use only the 2-inch ball diameter as indicated on the trailer's coupler. Use of any other ball diameter will create an extremely dangerous condition which can result in separation of the coupler and ball or ball failure.
3. Be sure the coupler is secured to the hitch ball and the lock lever is down (locked).
4. Attach safety chains as shown in Figure 7. Remember to cross the safety chains.
5. After towing for about 50 miles recheck the entire towing system for tightness.

Recommended Maintenance

1. Smear ball socket and clamp face with chassis grease. Periodically oil pivot points and wear surfaces of the coupler with SAE 30 W motor oil.
2. When parking or storing the light tower, keep the coupler off the ground so dirt and other debris will not build up in the ball socket.

Figure 7. Safety Chains/Trailer Coupler Hook-up
Tires/Wheels/Lug Nuts

Tires and wheels are a very important and critical components of the trailer. When specifying or replacing the trailer wheels it is important the wheels, tires, and axle are properly matched.

**WARNING - Wheel Repair/Modification**

DO NOT attempt to repair or modify a wheel. DO NOT install an inter-tube to correct a leak through the rim. If the rim is cracked, the air pressure in the inter-tube may cause pieces of the rim to explode (break-off) with great force and can cause serious eye or bodily injury.

Tires Wear/Inflation

Tire inflation pressure is the most important factor in tire life. Pressure should be checked cold before operation. DO NOT bleed air from tires when they are hot. Check inflation pressure weekly during use to insure the maximum tire life and tread wear.

Table 3 (Tire Wear Troubleshooting) will help pinpoint the causes and solutions of tire wear problems.

**WARNING - Safety Glasses Required**

ALWAYS wear safety glasses when removing or installing force fitted parts. Failure to comply may result in serious injury.

---

Suspension

The leaf suspension springs and associated components (Figure 8) should be visually inspected every 6,000 miles for signs of excessive wear, elongation of bolt holes, and loosening of fasteners. Replace all damaged parts (suspension) immediately. Torqued suspension components as detailed in Table 4.

---

**Figure 8. Major Suspension Components**
Lug Nut Torque Requirements
It is extremely important to apply and maintain proper wheel mounting torque on the trailer. Be sure to use only the fasteners matched to the cone angle of the wheel. Proper procedure for attachment of the wheels is as follows:

1. Start all wheel lug nuts by hand.
2. Torque all lug nuts in sequence. See Figure 9. DO NOT torque the wheel lug nuts all the way down. Tighten each lug nut in 3 separate passes as defined by Table 5.
3. After first road use, retorque all lug nuts in sequence. Check all wheel lug nuts periodically.

NEVER! use a pneumatic air gun to tighten wheel lug nuts.
Figure 10. Typical Trailer Wiring Diagram

NOTE:
LIGHTS ARE ORIENTED FROM THE DRIVER’S SEAT
Before Starting

1. Read all safety instructions at the beginning of manual.
2. Clean the light tower, removing dirt and dust, particularly the engine cooling air inlet and air cleaner.
3. Check the air filter for dirt and dust. If the air filter is dirty, replace air filter with a new one as required.
4. Check all fastening nuts and bolts for tightness.

5. When checking the engine oil, be sure to check if the oil is clean. If the oil is not clean, drain the oil by removing the oil drain plug, and refill with the specified amount of oil as outlined in the Perkins or Lombardini-Deutz Engine Owner's Manuals. Oil should be warm before draining.

Indoor Installation

Exhaust gases from diesel engines are extremely poisonous. Whenever an engine is installed indoors the exhaust fumes must be vented to the outside. The engine should be installed at least two feet from any outside wall. Using an exhaust pipe which is too long or too small can cause excessive back pressure which will cause the engine to heat excessively and possibly burn the valves.

Eliminate the danger of deadly carbon monoxide gas. Remember that exhaust fumes from any gasoline or diesel engine are very poisonous if discharged in a closed area. If the light tower is installed indoors, you must make provisions for venting the engine exhaust to the outside of the building.

Engine Oil Check

1. To check the engine oil level, place the make sure the light tower is placed on secure level ground with the engine stopped.
2. Remove the filler cap/dipstick from its holder and wipe it clean.
3. Insert and remove the dipstick from its holder. Check the oil level shown on the dipstick.
4. If the oil level is low, add oil through the oil filler hole, DO NOT overfill. Fill to the normal operating level as shown on the dipstick (Figure 28). Verify that the oil level is maintained between the two notches as shown in Figure 11. Always fill with recommended type oil as listed in Table 6. Reference Table 2 for engine oil capacity.

Other types of motor oils may be substituted if they meet the following requirements:

- API Service Classification CH-4
- API Service Classification CG-4
- API Service Classification CF-4
- ACEA Specification E3
- ACEA Specification E2
Fuel Check

**CAUTION - Diesel Fuel Safety**

*Diesel fuel* and its vapors are dangerous to your health and the surrounding environment. Avoid skin contact and/or inhaling fumes. **DO NOT** smoke while refueling. **DO NOT** attempt to refuel the light tower if the engine is *hot* or *running*.

1. To check the engine fuel level, make sure the light tower is placed on secure level ground with the engine stopped.
2. Lift the light tower access door (Figure 12) opposite the control panel. Set the door support latch in place to keep the door open (up).

![Figure 12. Adding Fuel](image)

3. Remove the fuel cap from the fuel tank as shown in Figure 12.

**CAUTION - Diesel Fuel Safety**

**ALWAYS** fill the fuel tank with clean, fresh *#2 diesel fuel*. **DO NOT** fill the fuel tank beyond its capacity. **DO NOT** TOP-OFF.

4. Pay attention to the fuel tank capacity when replenishing fuel. The fuel tank cap must be closed tightly after filling. Handle fuel in a safety container. If the container does not have a spout, use a funnel. Wipe up any spilled fuel immediately.

5. Wipe up any spilled fuel **immediately**!

Battery Check

**WARNING - Battery Safety**

The operator **MUST** wear the appropriate protective equipment and clothing while handling the battery.

Failure to wear protective equipment or clothing could result in **SERIOUS INJURY**.

**Battery** - The 12-volt DC battery (Figure 13) is shipped **dry**, and will require a proper electrolyte level for operation.

![Figure 13. Battery](image)

When servicing of the battery is required perform the following:

- A face shield and rubber gloves should be worn while handling and servicing battery's electrolyte.
- **Disconnect** battery terminal clamps, and remove the battery from the generator cabinet when servicing is required.
- **DO NOT** overfill the battery.

**WARNING - Battery Service Safety**

Electrolyte is an acid and must be handled with caution. Servicing instructions from the electrolyte manufacturer must **ALWAYS** be followed to ensure safety. Serious injury can result from careless handling and noncompliance to safety handling instructions.

Overfilling the battery may cause the electrolyte to overflow resulting in corrosion to nearby components. Immediately wash off any spilled electrolyte (battery acid).

Additionally, when connecting the positive (+) cable to the battery's positive (+) terminal post, **DO NOT** allow contact of the wrench or any metallic part to come in contact with the battery's negative (-) terminal post. This may result in an electrical short circuit or an explosion.

**NOTE**

Use only **distilled** water in the battery. Tap water can **reduce** the operating life of the battery.
Coolant (Ethylene Glycol [Green] / Water — 50/50 mix)

Use only drinkable tap water. If hard water or water with many impurities is used, the inside of the engine and radiator may become coated with deposits and cooling efficiency will be reduced.

An anticorrosion additive added to the water will help prevent deposits and corrosion in the cooling system. See the engine manual for further details.

WARNING - Radiator Burn Hazard

If adding coolant/antifreeze mix to the radiator, DO NOT remove the radiator cap until the unit has completely cooled. The possibility of hot coolant exists which can cause severe burns.

Day-to-day addition of coolant is done from the recovery tank. When adding coolant to the radiator, DO NOT remove the radiator cap until the unit has completely cooled. See Table 7 for engine and radiator, coolant capacities. Make sure the coolant level in the recovery tank is always between the "H" and the "L" markings.

Cleaning the Radiator

The engine may overheat if the radiator fins become overloaded with dust or debris. Periodically clean the radiator fins with compressed air. Cleaning inside the machine is dangerous, so clean only with the engine turned off and the negative battery terminal disconnected.

Air Cleaner

Periodic cleaning/replacement is necessary. Inspect it in accordance with the Perkins, Lombardini or Deutz Engine Owner's Manuals.

Fan Belt Tension

A slack fan belt may contribute to overheating, or to insufficient charging of the battery. Inspect the fan belt for damage and wear and adjust it in accordance with the Perkins, Lombardini or Deutz Engine Owner's Manuals.

The fan belt tension is proper if the fan belt bends 10 to 15 mm (Figure 14) when depressed with the thumb as shown below.

WARNING - Rotating Parts Hazard

NEVER place hands near the belts or fan while the engine is running.
The engine's exhaust contains harmful emissions. ALWAYS ventilate the exhaust when operating inside tunnels, excavations or buildings. Direct exhaust away from nearby personnel.

Before starting the engine perform the following:

1. Be sure to disconnect the electrical load and switch the main circuit breaker and all lamp (4) circuit breakers to the OFF position prior to starting the engine.
2. NEVER start the engine with any circuit breakers in the ON position.
3. Make sure light tower is placed on secure level ground with chock blocks underneath each wheel to prevent the light tower from rolling.
4. Outriggers have been fully extended to prevent the trailer from tipping.
5. All tower mast sections have been raised to the desired height.
6. Bottom tower mast is locked in place.
7. Light tower trailer support stands have been positioned properly and the trailer is level.
8. Flood lights have been adjusted to desired position.
9. Chocked blocks have been positioned under each wheel to prevent trailer from rolling.
10. Flood lights DO NOT interfere with any overhead obstructions.
11. Flood light power cables have been plugged into the appropriate receptacles (J1-J4) on the T-Bar assembly.
12. Light tower trailer frame has been grounded correctly.

NOTE

DO NOT attempt to start the engine until all the conditions referenced in steps 1 through 12 have been met.

WARNING - Respiratory Hazard

ALWAYS make sure the area above Light tower is open and clear of overhead power lines and other obstructions. The tower extends in excess of 30 ft. (9 meters). Contact with overhead powerlines or other obstructions could result in equipment damage, Serious Injury or Death!
Starting the Engine
The Night-Hawk LT-12 Series Light Tower is available with two types of engines (Perkins or Lombardini/Deutz). The engine starting procedure contained within this manual will address both engines.

Starting the Engine (Perkins Engines)
1. Open the access panel door on the right-side of the light tower (opposite the fuel tank). Set the door latch in place to hold the door open (up)
2. Insert the ignition key into the ignition switch (Figure 15). Turn the ignition key clockwise to the ON position. The pre-heat indicator lamp will be lit, wait for this indicator lamp to go OFF. When the lamp goes OFF this indicates that the glow plugs have been pre-heated and the engine can now be started.
3. Continue turning the ignition key all the way clockwise, when the engine has started, release the key.
4. Before placing the light tower into actual operation, let the engine run for 3-5 minutes. Listen of any abnormal sounds or smells that would be associated with a defective light tower. If any abnormal conditions occur, shut-down the light tower and correct the problem.

Starting the Engine (Lombardini/Deutz Engines)
1. Open the access panel door on the right-side of the light tower (opposite the fuel tank). Set the door latch in place to hold the door open (up)
2. Insert the ignition key into the ignition switch (Figure 16). Turn the ignition key clockwise one click to the ON position. The pre-heat indicator lamp will be lit, wait for this indicator lamp to go OFF. When the lamp goes OFF this indicates that the glow plugs have been pre-heated and the engine can now be started.
3. Continue turning the ignition key all the way clockwise, when the engine has started, release the key.
4. Before placing the light tower into actual operation, let the engine run for 3-5 minutes. Listen of any abnormal sounds or smells that would be associated with a defective light tower. If any abnormal conditions occur, shut-down the light tower and correct the problem.
Normal Shut-down

1. If a load is attached to the generating set of the light tower, remove the load.

2. Set CB-1 thru CB-4 on the control panel to the OFF position.

3. Place the MAIN circuit breaker (Figure 5, Item 4) on the control panel to the OFF position.

4. Wait a few seconds and observe that flood all floodlights are OFF.

5. Let the engine idle for a few minutes with no load.

6. Turn the ignition key to the OFF position. Store key in a safe location.

7. Lower light tower mast and place in stow position as outlined in the Pre-Setup section of this manual.

8. Place outriggers in tow position, and remove chock blocks.

9. Store light tower in a clean, dry location out of the reach of children and bystanders.

NOTE

Allow flood lights to cool (15 minutes) if service or removal of bulb is required.

Emergency Shut-down

1. Turn the ignition key to the OFF position.
Raising Mast (Top and Center Tower Sections)

Once the tower mast has been locked into its vertical position, the top and center tower sections can now be raised. These two tower sections allow the flood lights to be extended upwards in excess of 30 ft. Perform the following steps when extending the floodlights:

1. Locate the "vertical mast extension hand winch", see Figure 3, Item 2.
2. Turn the vertical mast extension hand winch lever clockwise, and observe that the flood lights begin to climb upward.
3. Continue turning the hand winch lever in the clockwise direction until the desired height has been reached.
4. Release the hand winch lever, this winch is of the self-locking type. The tension on the cable will keep the mast sections in place.

Lowering Mast (Top and Center Tower Sections)

1. Turn the vertical mast extension hand winch lever counter-clockwise, and observe that the flood lights begin to drop downward.
2. Continue turning the hand winch lever counter-clockwise until the top and center mast sections have been fully retracted (slack in the cable).

Lowering Mast (Lower Lower Section)

1. Remove the quick release locking pin to allow the mast section to be lowered to the horizontal section. Hold the locking pin open until the swivel base tab clears the lock.
2. Turn the vertical mast hand winch lever counter-clockwise, and observe that bottom tower mast begins to approach the horizontal position.
3. Continue turning the vertical hand winch lever in the counterclockwise direction. As the lower tower mast approaches the locking cradle, pull the tower release pin to allow the tower mast to rest in the cradle.
4. Once the lower mast is resting in the cradle of the tower support stand, align the hole on the mast with the hole on the cradle and insert locking pin.

Outriggers and Support Stands

1. Make sure both outriggers are extended. To extend the outriggers, pull the locking pin on the outrigger and hold while sliding out the outrigger assembly.
2. As soon as the pin clears the travel position hole, release it and continue sliding out the outrigger. The pin must snap into the outrigger locking hole in the extended position.
3. After extending all outriggers, rotate all trailer jack stands into the foot down position, then turn the crank handle on the jack stands clockwise to lower it and level the light tower.
4. Check behind the light tower and make sure all personnel and objects are clear of the mast.

Raising Mast (Lower Mast Section)

Follow the steps below to raise the lower mast:

1. To release the mast from the support stand locking cradle, PULL the large cradle locking pin (see Figure 3, item 9). This will unlock the mast from the horizontal position.
2. Remove the bottom mast quick release locking pin (see Figure 3, Item 17) before raising tower to the vertical position.
3. To place the mast in the vertical position, TURN the vertical winch hand lever (Figure 3, item 16) clockwise until the mast is pointing upwards at 90 degrees.
4. Once the mast in the vertical position and the mast lock captures the swivel base tab, insert the quick release locking pin to prevent the mast from falling.

Outriggers and Support Stands

1. Make sure both outriggers are extended. To extend the outriggers, pull the locking pin on the outrigger and hold while sliding out the outrigger assembly.
2. As soon as the pin clears the travel position hole, release it and continue sliding out the outrigger. The pin must snap into the outrigger locking hole in the extended position.
3. After extending all outriggers, rotate all trailer jack stands into the foot down position, then turn the crank handle on the jack stands clockwise to lower it and level the light tower.
4. Check behind the light tower and make sure all personnel and objects are clear of the mast.

Raising Mast (Lower Mast Section)

Follow the steps below to raise the lower mast:

1. To release the mast from the support stand locking cradle, PULL the large cradle locking pin (see Figure 3, item 9). This will unlock the mast from the horizontal position.
2. Remove the bottom mast quick release locking pin (see Figure 3, Item 17) before raising tower to the vertical position.
3. To place the mast in the vertical position, TURN the vertical winch hand lever (Figure 3, item 16) clockwise until the mast is pointing upwards at 90 degrees.
4. Once the mast in the vertical position and the mast lock captures the swivel base tab, insert the quick release locking pin to prevent the mast from falling.

Outriggers and Support Stands

1. Make sure both outriggers are extended. To extend the outriggers, pull the locking pin on the outrigger and hold while sliding out the outrigger assembly.
2. As soon as the pin clears the travel position hole, release it and continue sliding out the outrigger. The pin must snap into the outrigger locking hole in the extended position.
3. After extending all outriggers, rotate all trailer jack stands into the foot down position, then turn the crank handle on the jack stands clockwise to lower it and level the light tower.
4. Check behind the light tower and make sure all personnel and objects are clear of the mast.

Raising Mast (Lower Mast Section)

Follow the steps below to raise the lower mast:

1. To release the mast from the support stand locking cradle, PULL the large cradle locking pin (see Figure 3, item 9). This will unlock the mast from the horizontal position.
2. Remove the bottom mast quick release locking pin (see Figure 3, Item 17) before raising tower to the vertical position.
3. To place the mast in the vertical position, TURN the vertical winch hand lever (Figure 3, item 16) clockwise until the mast is pointing upwards at 90 degrees.
4. Once the mast in the vertical position and the mast lock captures the swivel base tab, insert the quick release locking pin to prevent the mast from falling.

Outriggers and Support Stands

1. Make sure both outriggers are extended. To extend the outriggers, pull the locking pin on the outrigger and hold while sliding out the outrigger assembly.
2. As soon as the pin clears the travel position hole, release it and continue sliding out the outrigger. The pin must snap into the outrigger locking hole in the extended position.
3. After extending all outriggers, rotate all trailer jack stands into the foot down position, then turn the crank handle on the jack stands clockwise to lower it and level the light tower.
4. Check behind the light tower and make sure all personnel and objects are clear of the mast.

Raising Mast (Lower Mast Section)

Follow the steps below to raise the lower mast:

1. To release the mast from the support stand locking cradle, PULL the large cradle locking pin (see Figure 3, item 9). This will unlock the mast from the horizontal position.
2. Remove the bottom mast quick release locking pin (see Figure 3, Item 17) before raising tower to the vertical position.
3. To place the mast in the vertical position, TURN the vertical winch hand lever (Figure 3, item 16) clockwise until the mast is pointing upwards at 90 degrees.
4. Once the mast in the vertical position and the mast lock captures the swivel base tab, insert the quick release locking pin to prevent the mast from falling.
Turning On the Flood Lights

The **Main Circuit Breaker** (25 amps), and 4 **floodlight circuit breakers** (10 amps each) are located on the upper control panel (Figure 20). Please note that there is one 10 amp circuit breaker for each floodlight.

1. Place the **Main circuit breaker** (Figure 17) on the control panel to the **ON** position.
2. Set CB-1 on the control panel to the **ON** position.
3. Wait a few minutes for the ballast to activate. Observe that flood light #1 is **ON**.
4. Repeat steps 2 and 3 for flood lights 2 through 4 (CB-2 through 4).
5. If all the **flood light circuit breakers** are in the **ON** position (up), then all of the lights should be on.
6. If any of the flood lights are not **ON** refer to the troubleshooting section of this manual.
7. **CLOSE** all cabinet doors.

Applying an External Load

The Night-Hawk LT-12 Series Light Tower is available with two auxiliary output receptacles (Figure 18). The upper most receptacle (twist-lock) located at the front of the light tower can provide 240 VAC at 25 amps. The bottom receptacle is a GFCI receptacle which can supply 120 VAC at 15 amps.

**NOTE**

Applying an External Load

The Night-Hawk LT-12 Series Light Tower is available with two auxiliary output receptacles (Figure 18). The upper most receptacle (twist-lock) located at the front of the light tower can provide 240 VAC at 25 amps. The bottom receptacle is a GFCI receptacle which can supply 120 VAC at 15 amps.

**Testing the 120 VAC GFCI Receptacle**

Pressing the **reset** button resets the GFCI receptacle after being tripped. Pressing the **“Test Button”** (See Figure 19) in the center of the receptacle will check the GFCI function. Both receptacles should be tested at least once a month.

**DANGER - Electric Shock Hazards**

NEVER grab or touch a live power cord with wet hands, the possibility exists of electrical shock, electrocution, and even death!
Use Table 9 shown below as a general checklist to be performed on a daily basis. For more detailed maintenance refer to the Perkins or Lombardini/Deutz engine service manuals.
Check Cable Wear

The wire rope (cable) that raises and extends the mast is a very important part of the light tower. There is one cable/hand winch system, located on the tongue of the trailer, that raises and extends the light tower mast. There is a second cable/hand winch system located on the mast that serves to raise and lower the two extendable sections of the mast.

**DANGER - Light Tower Cable System Safety**

Wire rope (cable) will fail if it is worn, frayed, misused, crushed, kinked or damaged in any way. **ALWAYS** check the cables and pulleys for any abnormalities before use. **DO NOT** use it if there is even the slightest cause for concern and replace any damaged cables or pulleys immediately.

**WARNING - Mast Service Safety**

The mast sections are heavy and awkward to handle. Use proper lifting devices and procedures when servicing the mast and its components.

Servicing the Mast Extension Cable System:

To replace the cable in the mast extension cable system, use the following steps (Reference Figure 21):

1. Lower the mast to the horizontal resting position.
2. Inspect the cable clamps, pulleys, and other components for worn or damaged parts. If either of the cables on the mast needs to be replaced, they should both be replaced at the same time.
3. Disassemble the mast by disconnecting the cables from the mast and sliding the sections apart. The lower cable can be disconnected from the winch.
4. There are two pulleys in the mast raise/lower cable system. They should be removed, and replaced if worn or damaged, as they can cause premature cable failure if they are in poor condition.
5. Reassemble the mast extension cable system by connecting the cable to the bottom of the upper mast and sliding the upper mast into the opening of the center mast. Connect the second cable to the bottom of the center mast and slide the center mast into the opening of the lower mast, observing proper lifting techniques.
6. Route the upper mast cable through the center mast pulley and connect the free end of the cable to the lower mast ankle shackle. Route the center mast cable through the lower mast pulley and connect the free end of the cable to the hand winch at the bottom of the lower mast.
7. Raise, extend, retract and lower the mast several times to verify correct operation.

**Servicing the Mast Raise/Lower Cable System:**

To replace any components in the mast raise/lower cable system, use the following steps (Reference Figure 20):

1. Lower the mast to the horizontal resting position.
2. Inspect the cable clamps, pulleys, and other components for worn or damaged parts.
3. Disconnect the cable from the ball socket pin and remove from the mast pulley and cable sheave. Detach the cable from the hand winch as necessary.
4. Replace the pulley and the cable as needed.
5. Re-thread the cable through the pulley and reattach the cable to the ball socket pin.
6. Raise and lower the mast several times to verify correct operation.

Figure 20. Mast Raise/Lower Cable System

Figure 21 Mast Extension Cable System
General Inspection
Prior to each use, the generating set should be cleaned and inspected for deficiencies. Check for loose, missing or damaged nuts, bolts or other fasteners. Also check for fuel or oil leaks.

Air Cleaner
Every 50 hours: Check dust indicators on control panel. If light is ON, clean the air cleaner element.
1. Un-latch the holding clips and take out the air cleaner element.
2. Clean the inside of the body and cover using a damp cloth.
3. Blow dry with compressed air (0.69Mpa {7kgf.cm², 99.4 PSI} maximum) against the side of the element along the pleats. Then blow dry against outside along the pleats, then against inside again.
4. Remove one seal each time the element is cleaned.
5. Replace the outer element after cleaning it 6 times or after one year. Replace the outer element if indicator is red even after cleaning it.
6. If seal washer is damaged or the threads of wing nut are damaged, replace.
7. Remove evacuator valve and clean it with compressed air. Reinstall.

Fuel Addition
Add diesel fuel (the grade may vary according to season and locations). Always pour through the mesh filter.

Removing Water from the Tank
After prolonged use, water and other impurities accumulate in the bottom of the tank. Occasionally remove the drain cock and drain the contents. During cold weather, the greater the empty volume inside the tank, the easier it is for water to condense. This can be reduced by always keeping the tank as full as possible.

Air Removal
If air enters the fuel injection system of a diesel engine, starting becomes impossible. After running out of fuel, or after disassembling the fuel system, bleed the system according to the following procedure.
To restart after running out of fuel, squeeze the fuel primer bulb to pump fuel into the engine. This unit is equipped with an automatic air bleeding system.

Service Daily
If engine is operating in very dusty and dry grass conditions, a clogged air cleaner will result in high fuel consumption, loss of power and excessive carbon buildup in the combustion chamber.

Cleaning the Fuel Strainer
Clean the fuel strainer if it contains dust or water. Remove dust or water in the strainer cap and wash it in diesel. Securely fasten the fuel strainer cap so that fuel will not leak. Check the fuel strainer every 200 hours of operation or once a month.

Check Oil Level
Check the crankcase oil level prior to each use, or when the fuel tank is filled. Insufficient oil may cause severe damage to the engine. Make sure the generator is level. The oil level must be between the two notches on the dipstick as shown in Figure 14.
Allow engine to cool when flushing out radiator. Flushing the radiator while hot will damage radiator. In addition the possibility of hot coolant exists which can cause severe burns.

**Flushing Out Radiator and Changing Coolant**

1. Stop the engine and allow to cool. Tighten valve of the corrosion resistor (if equipped).
2. Turn water filler cap slowly and remove it.
3. Prepare a container to catch the coolant, then open drain plug of the radiator or heat exchanger and drain plug of the engine, and drain the coolant.
4. After draining the coolant, close drain plugs and fill with tap water.
5. When the water level is near the mouth of the water filler, open drain plugs and start the engine, and run at low idling. Keep the engine running at low idling and flush the radiator for about 10 minutes.
6. Adjust the flow of the water flowing in and draining out to ensure that the radiator is always full during the flushing operation. While flushing water through the system, watch carefully the water inlet hose does not come out of the radiator filler port.
7. After flushing, stop the engine, open drain plug and drain the water, then close drain plugs.
8. After draining the water, flush the system with a flushing agent. See instructions on flushing agent label.
9. After flushing, open drain plugs and drain out all the water, then close drain plugs and add tap water so the water level is near the mouth of the water filler.
10. When the water level is near the mouth of the water filler, open drain plugs and start the engine, run at low idling and continue to flush the system until clean water comes out. Adjust the flow of the water flowing in and draining out to ensure the radiator is always full during the flushing operation.
11. When clean water comes out, stop the engine, drain all the water, then close drain plugs.
12. Remove the corrosion resistor (if equipped) and open valve.
13. Supply water until it flows over the water filler.
14. Drain the water inside reserve tank, clean the inside of the reserve tank, then fill with coolant/water mixture to between the full and low lines.
15. Stop the engine, wait for 3 minutes, add tap water until the water level reaches near the water filler port, then tighten the radiator cap.

**Changing Oil**

1. Make sure the oil is cool before changing.
2. Set a container directly under the drain plug of the oil pan. Loosen the drain plug slowly.
3. Check the drained oil for excessive metal particles or foreign material. Contact the distributor if there is metal particles or foreign material.
4. Using a filter wrench, turn filter cartridge to the left to remove it. If the filter cartridge is filled with a large amount of oil, wait 10 minutes or so before removing. Make sure there is no old gasket stuck on the filter holder.
5. Tighten drain plug. Clean the filter holder, fill the new filter cartridge with clean engine oil, coat the packing and thread of the new filter cartridge with engine oil, then install it to the filter holder. Tighten until the gasket surface contacts the seal surface of the filter holder, then tighten it a further 3/4 to 1 turn.
6. Add engine oil through oil filler until the oil level is between the H and L marks on the dipstick.
7. Run the engine at idling for a short time, then stop the engine. Recheck the oil level and fill as necessary.
Refrigerated Storage:

1. Fill the fuel tank completely. Treat with fuel stabilizer if necessary.
2. Completely drain oil from the crankcase and refill if necessary with fresh oil.
3. Clean the entire light tower, internal and external.
4. Disconnect the negative terminals of the battery and cover it, or remove it from the generator and store it separately.
5. If the ambient temperature is expected to drop below 0°C, add antifreeze to the radiator.
6. Cover the light tower and store in a clean, dry place away from children and non-qualified personnel.

Removal From Long Term Storage:

1. Apply oil to the engine valve and rocker arms, and examine the operating condition of the valves.
2. Change the oil in engine oil pan.
3. Replace all the filters.
4. Flush the inside of the cooling system.
5. Drain the water from the fuel tank and bleed the air from the fuel system.
6. If the engine has not been started for more than one year, contact your Perkins or Lombardini/Deutz distributor to have engine overhauled.

Replacing Fuel Filter

1. Set the container under the filter cartridge to catch fuel.
2. Using a filter wrench, turn the filter cartridge to the left to remove it.
3. Clean the filter holder, fill the new filter cartridge with fuel, coat the packing surface of the filter cartridge with engine oil, then install the cartridge to the filter holder.
4. When installing, tighten until the packing surface contacts the seal surface of the filter holder then tighten a further 2/3 of a turn. If the filter cartridge is tighten too much, the packing will be damaged and will cause fuel leakage. Fuel leakage will occur if the filter cartridge is not tightened enough. Always tighten to the correct angle.
5. Squeeze the fuel primer bulb to pump fuel back into the engine.
6. Replace Corrosion resistor cartridge (if equipped)
7. Screw in valves at the top of the corrosion resistor.
8. Using a filter wrench, turn the cartridge to the left to remove it.
9. Coat the seal surface of the new cartridge with engine oil and install it to the filter holder.
10. Tighten until the packing surface contacts the seal surface of the filter holder, then tighten a further 2/3 of a turn.
11. Open valves.
Practically all breakdowns can be prevented by proper handling and maintenance inspections, but in the event of a breakdown, please take a remedial action following the diagnosis based on the Generator Troubleshooting (Table 10) information shown below and on the following page. If the problem cannot be remedied, please leave the unit just as it is and consult our company's business office or service plant.
Practically all breakdowns can be prevented by proper handling and maintenance inspections, but in the event of a breakdown, please take a remedial action following the diagnosis based on the Engine Troubleshooting (Table 11) information shown below and on the following page. If the problem cannot be remedied, please leave the unit just as it is and consult our company’s business office or service plant.
Practically all breakdowns can be prevented by proper handling and maintenance inspections, but in the event of a breakdown, use Table 12 shown below and the Troubleshooting Guide as a basic guideline for troubleshooting lamp malfunctions. If the problem cannot be remedied, consult our company’s business office or service plant.
TROUBLESHOOTING GUIDE

Use the following procedure and wiring diagram on the opposite page to determine which of the four floodlights is not functioning:

Connections:
1. Make sure that floodlight #1 power cable is plugged into the J1 connector on the T-Bar assembly.
2. Make sure that floodlight #2 power cable is plugged into the J2 connector on the T-Bar assembly.
3. Make sure that floodlight #3 power cable is plugged into the J3 connector on the T-Bar assembly.
4. Make sure that floodlight #4 power cable is plugged into the J4 connector on the T-Bar assembly.
5. With the voltmeter set to the AC position, connect the negative lead of the AC voltmeter to any (neutral) white wire on the junction terminal block. This blocks connects all the neutral wires (white) in the system.
6. Connect the positive lead of the voltmeter to the output side of CB1, and observe that 120 VAC is present. Make sure circuit breaker is ON.
7. Repeat step 1-6 for CB2 thru CB4.
8. If the correct output voltages are present for CB1 thru CB4 then it can be assumed that the generator is working correctly and the correct voltage (120 VAC) are being supplied to the ballast.

Starting:
1. Start the generator and verify that there are no abnormal sounds.
2. Turn CB1 thru CB4 circuit breakers to the ON position.
3. Wait a few minutes and determine which flood light is not igniting.
4. If one of the floodlights is OFF, disconnect its power cable and plug it into a receptacle that is known to be working. DO NOT unplug a power cable from the T-Bar while power is being supplied by the generator. Always turn the circuit breaker OFF before un-plugging a power cable.
5. If the floodlight still does not ignite after plugging it into a working receptacle (120 VAC present), then it can be assumed that the ballast for that flood light is defective. Replace ballast.

Ballast Removal:
1. Remove the power cable from the generator or welder, and make sure that no voltage is being supplied to the ballast compartment.
2. Remove the four screws securing the ballast cover, and remove cover.
3. Make sure to discharge the ballast capacitor.
4. Remove the defective ballast, taking care to guard against electrical shock when coming in contact with the ballast and capacitor. The capacitor is known to store an electrical charge, that when discharged could result in a harmful shock. Make sure to discharge capacitor.
Capacitors C1 thru C4 are 480 VAC, 24 μf. In addition a 47K Ω (1/2 watt) resistor is installed across the capacitor terminals (may be internal or externally installed).
HERE’S HOW TO GET HELP

PLEASE HAVE THE MODEL AND SERIAL NUMBER ON-HAND WHEN CALLING

PARTS DEPARTMENT
800-427-1244   FAX: 800-672-7877
